

## **How 340B Supports Health Center Patients**

By lowering how much they must pay for pharmaceuticals, **340B** enables health centers (FQHCs) to:

- Make drugs affordable for their low-income uninsured and underinsured patients, and
- Support other key services that expand access to their medically vulnerable patients.

## Why is 340B so critical to health centers?

- As small, community-based organizations, health centers lack the market power to negotiate discounts off the sticker price.
- Prior to 340B, most health centers were unable to offer affordable pharmaceuticals to their patients.

Health centers are a tiny part of the total 340B program – accounting for only 6% of national 340B sales. But 340B is critical to health centers' ability to provide affordable drugs & other services to underserved individuals.

How does 340B expand access and generate savings for health centers and their patients? Say the regular price for a drug is \$100, and the 340B price is \$70. The health center or its contract pharmacy dispense two bottles of the drug – one to an uninsured patient for whom the sliding fee copay is \$20, and the second to a patient with private insurance that reimburses the drug's regular price.

Without 340B				With 340B			
	Sliding Fee Patient			The FQHC loses	Sliding Fee Patient

	Net Cost	\$80	\$80	uninsured	Net Cost	\$50	\$50
the sliding	Insured Patient			patient is	Insured Patient		
discount	Drug Cost	\$100	FQHC	reduced \$50, and they retain \$30	Drug Cost	\$70	FQHC
	Insurance Pays	<u>\$100</u>	breaks	savings on the	Insurance Pays	\$100	retains \$30
	Net Cost	\$0	even	insured patient.	Net Savings	\$30	savings

## How do health centers use the savings generated by 340B?

- Health centers invest <u>every penny</u> of 340B savings into activities that expand access to their medically-underserved patients. This is required by Federal law<sup>1</sup>, Federal regulations<sup>2</sup> -- and the health center mission.
- Each health center's patient-run Board decides how to best invest its 340B savings.
  - First, they offset losses on drugs for sliding fee patients (e.g., the \$50 loss above.)
  - Remaining savings are used for services that could not otherwise be funded. Common examples include expanded SUD treatment, clinical pharmacy programs, and adult dental services.

## How are 340B Prices Calculated? A drug's 340B price is its Average Manufacturer Price (AMP) less:

- Mandatory discount: 23% for brand-names & 13% for generics,
- Inflation Penalty (if applicable):
  If the manufacturer increases the
  drug's sticker price faster than
  inflation, an additional discount
  is required. If the price rises fast
  enough, the total discounts can
  exceed the AMP. In this case, the
  340B price is one penny.
